Dear Barbara:

Arriving 8/28 will work for me as well.

My research interests are close to yours in the sense that I have been applying stochastic modeling for the evaluation of several domains such as: survivability analysis of mission critical systems, security intrusion detection, modeling of disasters in software systems, etc...Currently I am researching how to apply these techniques to guide software re-factoring of Java based systems.

Looking forward to the SESChool,

Alberto

> Being together is really an exceptional situation and I would also like to start collecting your ideas on how to work together. Maybe you can tell what is the topic you would be interested in. Starting from myself, I am interested in mining software repositories to define principles of software evolution and mining logs to model system behaviour and use. I am using different means for such analyses from text processing to stochastic modelling and prediction systems.

Could you please send me such information in the next two days?

Thank you again

Best regards

Barbara
